Outlook

Bloom Energy AI Surge Tests Fuel-Cell Scale-Up: Equity Outlook

(Bloomberg Intelligence) -- THESIS: Bloom Energy's revenue growth can ride AI-fueled power constraints as its solid-oxide fuel cells give hyperscalers, data-center developers and utilities a faster onsite-power option amid grid delays and multiyear gas-turbine backlogs. We calculate US data-center power demand can reach about 600 terawatt-hours by 2030, or 14% of national use, while the company's pipeline approached $20 billion in 2025 and sales rose 37% to $2.02 billion. Guidance points to a near doubling in top-line growth this year, but Oracle, Brookfield and AEP orders will test whether Bloom can scale up factories, lift margins and turn backlog into cash flow. (09/24/26)

Key Topics Summary

Leopold-Citadel Situation: Bloom Energy's premium valuation as a key AI-power scarcity proxy matters more than ownership changes involving Situational Awareness and Citadel. Though 2Q guidance lifted revenue expectations to $3.9-$4.2 billion for 2026, the company still trades at about 15x the midpoint of that range on a $60.6 billion enterprise value. Factory output, site readiness, shipment cadence and service revenue from installed assets will determine whether the 2027-28 revenue ramp grows into today's valuation.

Data-Center Demand: Bloom Energy's AI-power push resets the revenue outlook, with 2026 sales guidance now implying about 80% growth vs. 60% previously. The Oracle deal, including 1.2 GW across US projects and a master agreement for as much as 2.8 GW, anchors the step-up. Additional data-center wins can boost the top line further, but execution hinges on factory expansion, project timing and working-capital control.

Bloom's Manufacturing Ramp Up: Bloom Energy's AI-power earnings upside rests on converting demand into cash. A backlog approaching $20 billion and planned 2 GW factory capacity by year-end frame the opportunity, but Oracle, AEP and Brookfield's data-center orders will test production cadence, installation timing and scandium sourcing resilience.

Path to Hydrogen: Bloom Energy's hydrogen story is more about optionality than a near-term sales driver, with solid-oxide technology supporting fuel-cell power and electrolysis. The platform screens well on efficiency, but the financial debate centers on whether lower electricity intensity can translate into orders, factory utilization and service revenue beyond natural-gas-powered data-center growth.

This report may not be modified or altered in any way. The BLOOMBERG PROFESSIONAL service and BLOOMBERG Data are owned and distributed locally by Bloomberg Finance LP ("BFLP") and its subsidiaries in all jurisdictions other than Argentina, Bermuda, China, India, Japan and Korea (the "BFLP Countries"). BFLP is a wholly-owned subsidiary of Bloomberg LP ("BLP"). BLP provides BFLP with all the global marketing and operational support and service for the Services and distributes the Services either directly or through a non-BFLP subsidiary in the BLP Countries. BFLP, BLP and their affiliates do not provide investment advice, and nothing herein shall constitute an offer of financial instruments by BFLP, BLP or their affiliates.

This document is being provided for the exclusive use of YUBO SUI at THE CHINESE UNIVERSITY OF HONG KONG. Not for redistribution.

Cash Flow Inflection: Bloom Energy's cash-flow inflection can accelerate in 2026 as onsite power-server adoption rises with AI data-center demand. Operating cash flow is poised to climb nearly 40% vs. 2025 to $157 million, while $600-$750 million operating-income guidance points to stronger leverage as enterprise demand scales up toward gigawatt-scale deployments.

Financial Review

Earnings

Bloom's AI Power Ramp Doubles 2026 Sales Scope: Earnings Outlook

Post-2Q Earnings Outlook: Bloom Energy's second boost to 2026 revenue guidance turns the AI power story into a delivery test, with shipments now strong enough to put sales on pace to double this year. The new $3.9-$4.2 billion outlook, up from $3.4-$3.8 billion, leaves the 34% margin target intact as 2026 shipments accelerate. Oracle remains the clearest hyperscaler anchor, while Brookfield's $25 billion financing commitment gives AI-power projects a deeper capital base. With 2Q operating income at $240 million, up more than sevenfold year over year, Bloom has more room to turn factory scale into earnings upside.

Management reiterated scandium oxide visibility for 25 GW and no China dependency, but year-end execution will show whether manufacturing and its supply chain can support a steeper AI shipment schedule. (07/29/26)

Highlights From Recent Results:

- Full-Year Sales on Pace to Double After 2Q Guidance Raise
- 2026 Adjusted Gross Margin Holds at 34% as AI Shipments Scale
- Oracle Anchor and Brookfield Capital Keep AI Power Ramp in View
- 2Q Operating Income Jump Shows Factory Scale Driving Profitability

Long-Term Drivers

Bloom Energy’s Top-Line Runway Can Lengthen on AI Power Demand

Bloom Energy's data-center revenue upside can extend through the end of the decade, with our scenario showing the top line rising more than 4x by 2028 as AI power demand lifts product sales and gross margin. Oracle anchors the first step-up via an expanded agreement for 1.2 gigawatts across US projects and as much as 2.8 GW under a master pact, while Brookfield, AEP and Equinix add infrastructure capital, utility and colocation channels.

Speed and capacity underpin the long-term case: Management says modular fuel-cell systems can be delivered in as little as 90 days and existing factories can reach 2 GW of capacity by year-end, with facilities scalable to 5 GW. Project timing, service performance and working capital remain the swing factors determining how much AI demand converts into durable cash flow. (07/17/26)

This report may not be modified or altered in any way. Valuation

Demand Conversion

Bloom Energy Valuation Premium Rests on AI Data-Center Execution

Bloom Energy's 13.1x forward EV-to-revenue multiple, approaching double its two-year average of 7.1x, puts AI data-center conversion at the center of the valuation story. The premium hinges on Oracle, Brookfield, AEP and Equinix commitments turning into shipments, backlog and operating cash flow, with our scenario pointing to revenue rising more than 4x by 2028. Execution is the pressure point: 2026 guidance already assumes a steep ramp-up, and any delay in factory scale, installations or working-capital recovery could expose the multiple to mean reversion. The EV-to-Ebitda ratio is also above its two-year average, reflecting confidence that AI demand can convert into sustained revenue and margin growth. (07/16/26)

Key Topics

Leopold-Citadel Situation

Bloom's Leopold-Citadel Reset Puts AI-Power Premium on Trial

Contributing Analysts Will Hares (Energy)

Bloom Energy's premium valuation as a key AI-power scarcity proxy matters more than ownership changes involving Situational Awareness and Citadel. Though 2Q guidance lifted revenue expectations to $3.9-$4.2 billion for 2026, the company still trades at about 15x the midpoint of that range on a $60.6 billion enterprise value. Factory output, site readiness, shipment cadence and service revenue from installed assets will determine whether the 2027-28 revenue ramp grows into today's valuation. (08/03/26)

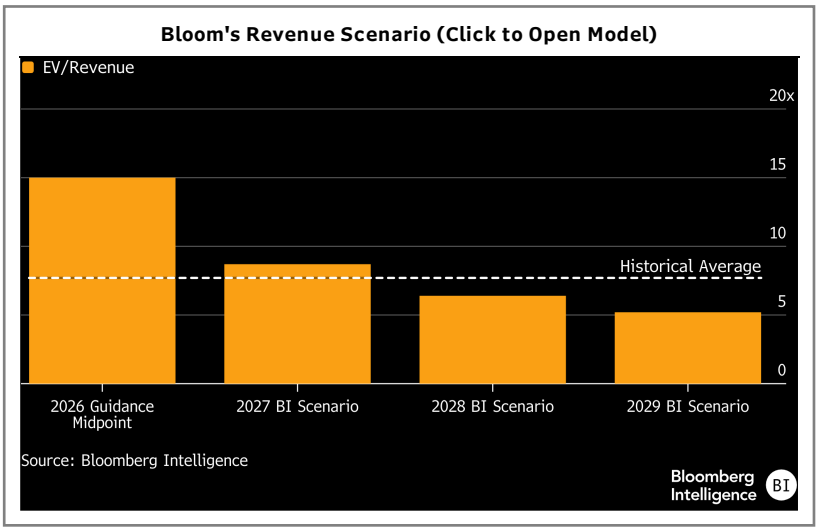

2028 Delivery Must Catch the Multiple

Leopold Aschenbrenner's Situational Awareness made Bloom a flagship AI-infrastructure holding, and reports of Citadel buying much of its public-equity book are overshadowing the hefty valuation. Bloom's 2028 sales path now carries the valuation case after 2Q lifted the revenue base and the reported Citadel purchase may have eased the Situational Awareness overhang.

Bloom's higher estimates have pulled EV to sales to 10.8x from a one-year average of 11.9x, but the screen multiple is already looking past this year. At $60.6 billion, Bloom trades at 15x the $4.05 billion midpoint of 2026 revenue guidance. Our scenario sees revenue to $7 billion in 2027 and $9.5 billion in 2028, reducing EV to sales to 8.7x and 6.4x with enterprise value held flat.

The company's two-year average of 7.1x comes back only once sales reach about $8.5 billion, leaving 2028 as the first year that can absorb today's valuation.

Shipments, service margins and cash conversion will determine whether operating performance grows into today's multiple, or whether the valuation remains ahead of the business. (09/01/26)

Situational Awareness Kept Bloom as AI-Power Proxy

Situational Awareness made Bloom the visible equity expression of the AI-power trade before Citadel entered the story. The fund's 1Q filing, submitted in May, showed its Bloom common-share position fell to 6.5 million shares from 10.1 million at 4Q25, while disclosed value held near $878.7 million after the re-rating. Calls on 408,500 underlying shares were unchanged. The trim shows SA was reducing the

position before the July losses, not that Bloom's link to the fund had broken. Bloom remained SA's largest disclosed long common-stock position, keeping the equity tied to a crowded AI-infrastructure portfolio.

Reports that Citadel bought much of SA's public-equity book may have eased forced-sale pressure. They didn't change backlog, customer timing or capacity and instead moved the burden back to Bloom's 2027-28 delivery path. (09/01/26)

Situational Awareness' Holdings 1Q26

Routes to Market Must Turn Into Cash

Bloom's route-to-market mix has to prove the $9.5 billion 2028 sales path is more than a single-customer ramp. Oracle gives hyperscale demand, Brookfield gives project capital, AEP adds a utility channel and Equinix/CoreWeave show data-center references. Each route carries a different revenue trigger, making conversion the point of the exhibit. Oracle has to become site-ready shipments, Brookfield installed assets, AEP repeat utility procurement and Equinix/CoreWeave repeat orders with clean uptime and service margin. Management says capacity isn't the current constraint, has scandium visibility for 25 gigawatts and isn't dependent on China. The 2028 case now lives in delivery data, not partner logos. (09/01/26)

Bloom Energy Agreements

Route	Partner	Scope	Conversion Test
Hyperscale	Oracle	Up to 2.8 GW, including initial 1.2 GW	Site readiness and shipment cadence
Capital	Brookfield	$25 billion financing framework	Financing turning into installed assets
Utility	AEP	Up to 1 GW, initial 100 MW	Utility procurement becoming repeat channel
Data-center operators	Equinix/CoreWeave	Multi-site colocation and AI references	Repeat orders, service margin and uptime

Data-Center Demand

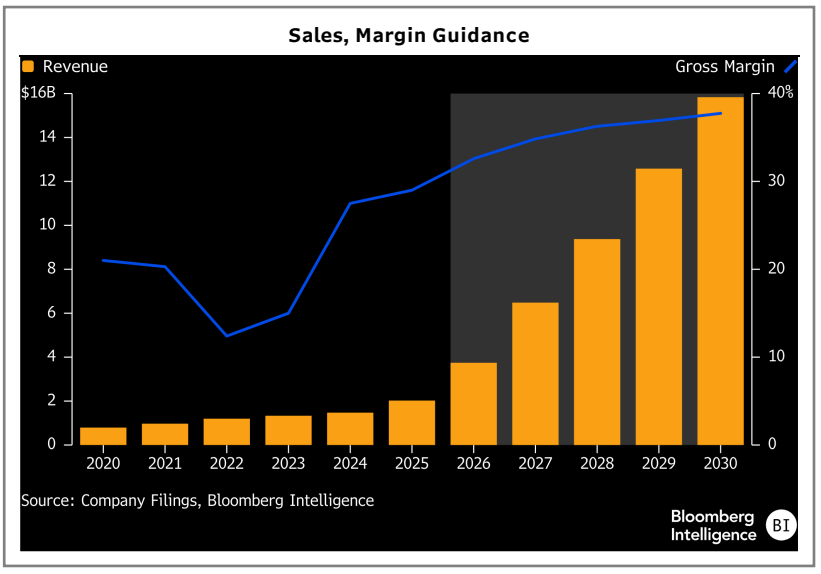

Bloom's Oracle Deal Anchors Bolder Data-Center Sales Ambition

Bloom Energy's AI-power push resets the revenue outlook, with 2026 sales guidance now implying about 80% growth vs. 60% previously. The Oracle deal, including 1.2 GW across US projects and a master agreement for as much as 2.8 GW, anchors the step-up. Additional data-center wins can boost the top line further, but execution hinges on factory expansion, project timing and working-capital control. (07/22/26)

Data Centers at Heart of 2026 Guidance Reset

Bloom Energy's expanded Oracle deal, including 1.2 gigawatts across US projects and a master agreement for as much as 2.8 GW, is the clearest driver of its 2026 guidance recalibration. The top-line target increased to $3.4-$3.8 billion from $3.1-$3.3 billion after 1Q, while the gross-margin ambition climbed to about 34% from 32%. The order adds a large hyperscale customer to Bloom's data-center thesis and shifts the debate to delivery from power-shortage optionality. Project timing, factory output, installation capacity and working-capital control will determine how much of Oracle's demand becomes durable sales and cash flow.

A repeatable hyperscale template, not one large order, is the longer-term test, with margin preservation vital as volume ramps up. (07/22/26)

AI Power Deals Provide More Routes to Market

Bloom Energy's AI-power pipeline spans direct cloud demand, infrastructure capital, utilities and colocation, broadening its route to data-center load beyond a single hyperscale win. Oracle anchors demand with as much as 2.8 GW, including an initial 1.2 GW, while Brookfield adds a $25 billion AI-infrastructure power framework. AEP opens a utility channel with as much as 1 GW and an initial 100-megawatt order, and Equinix shows repeat colocation use with more than 100 MW across 19 US data centers. The mix widens access to buyers facing delayed grid connections but also brings counterparty, financing and site-execution risk. Conversion and revenue timing, not announcements, will determine whether the pipeline translates into tangible growth. (07/22/26)

Bloom Energy Agreements

Route to Market	Partner	Announced Scope	Notes
Hyperscale Cloud	Oracle	Up to 2.8 GW, including initial 1.2 GW across US projects	Bloom can be a direct power solution for large AI-cloud deployments
Infrastructure Capital	Brookfield	$25 billion AI-infrastructure power framework, expanded from $5 billion	Financing partners may help Bloom scale deployments without relying only on customer balance sheets
Utility Procurement	AEP	Up to 1 GW, including initial 100 MW order	Utilities may become a channel to serve data-center loads with colocated onsite power
Colocation	Equinix	More than 100 MW across 19 US data centers	Existing data-center operators have deployed Bloom across multi-site footprints
AI Cloud Proof Point	CoreWeave	Strategic deployment at Volo, Illinois AI data center	Bloom has an early reference customer tied directly to GPU-heavy AI workloads

Source: Company Filings, Bloomberg Intelligence

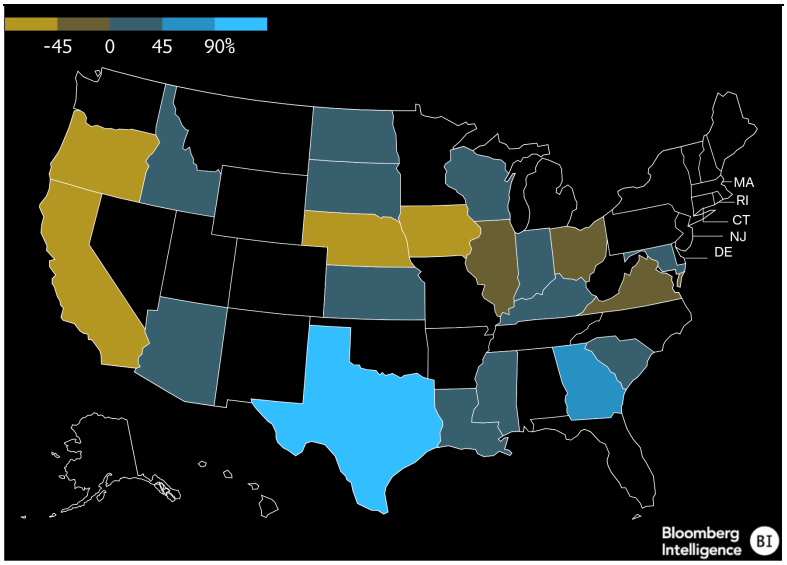

Bloomberg Intelligence BI

Onsite Power Demand Rises as Grid Timelines Slip

Onsite power is moving into the primary-supply discussion as data-center grid access tightens, expanding Bloom Energy's opening where speed matters as much as power cost. The company's November 2025 survey found around one-third of US data centers could use 100% onsite power by 2030, with 73% of respondents evaluating or selecting onsite-power providers. BloombergNEF's view that behind-the-meter data-center power can grow 57x reinforces the shift.

Bloom's scope to capture demand is strongest where utility capacity, interconnection queues and transmission constraints delay projects, though gas access, permitting, emissions goals and utility rules threaten to limit adoption. Customer economics will decide durability. (07/22/26)

Expected Change in 2028 Data-Center Share by State

2030 Onsite-Power Potential Grows 33x in Bloom Survey

(07/22/26)

Bloom's Manufacturing Ramp Up

Bloom Energy AI Power Upside Hinges on Building Factory Scale

Bloom Energy's AI-power earnings upside rests on converting demand into cash. A backlog approaching $20 billion and planned 2 GW factory capacity by year-end frame the opportunity, but Oracle, AEP and Brookfield's data-center orders will test production cadence, installation timing and scandium sourcing resilience. (07/13/26)

Scandium Risk Manageable for Fuel-Cell Ramp-Up

Contributing Analysts Jack Baxter (Metals & Mining)

Scandium supply is unlikely to cap Bloom Energy's 2-5 gigawatt factory expansion, making cost, qualification and sourcing resilience the bigger risks. The rare-earth metal is used in oxide form as a dopant -- a trace additive that improves the conductivity and durability of the company's ceramic electrolyte, the layer in solid-oxide fuel cells that lets ions move and generate power.

Management says scandium oxide is only a small part of the electrolyte, is sourced from multiple countries and suppliers, and isn't dependent on China. It also indicates current supply supports 25 GW of annual production and alternative materials can play a similar role, though scandium is preferred. Saleable-form availability and procurement timing still bear watching, especially as defense users face tighter China-sourcing limits. (09/01/26)

This report may not be modified or altered in any way. The BLOOMBERG PROFESSIONAL service and BLOOMBERG Data are owned and distributed locally by Bloomberg Finance LP ("BFLP") and its subsidiaries in all jurisdictions other than Argentina, Bermuda, China, India, Japan and Korea (the "BFLP Countries"). BFLP is a wholly-owned subsidiary of Bloomberg LP ("BLP"). BLP provides BFLP with all the global marketing and operational support and service for the Services and distributes the Services either directly or through a non-BFLP subsidiary in the BLP Countries. BFLP, BLP and their affiliates do not provide investment advice, and nothing herein shall constitute an offer of financial instruments by BFLP, BLP or their affiliates.

This document is being provided for the exclusive use of YUBO SUI at THE CHINESE UNIVERSITY OF HONG KONG. Not for redistribution.

Scandium Oxide Risk Factors

Risk factor	Bloom Impact
End-Market Demand	Defense and solid-oxide fuel cells are the main scandium-oxide use cases, leaving fuel cells as the key commercial demand pool
China /Defense Rules	Military applications face tighter China-sourcing limits, making non-China supply strategically important for defense
Material Intensity	Bloom says scandium oxide is only a small dopant in its ceramic electrolyte, reducing volume risk
Supply Scale	Bloom says it sources from multiple countries and suppliers and current supply can support up to 25 GW/year
Saleable Form	Commercial supply still needs to reach saleable scandium-oxide form, typically above 99% content
Substitution	Bloom says alternative materials can perform a similar role, though scandium remains preferred for today's platform
Residual Risk	Cost, qualification, recovery economics and logistics could still pressure margins or deployment timing

Source: Bloomberg Intelligence

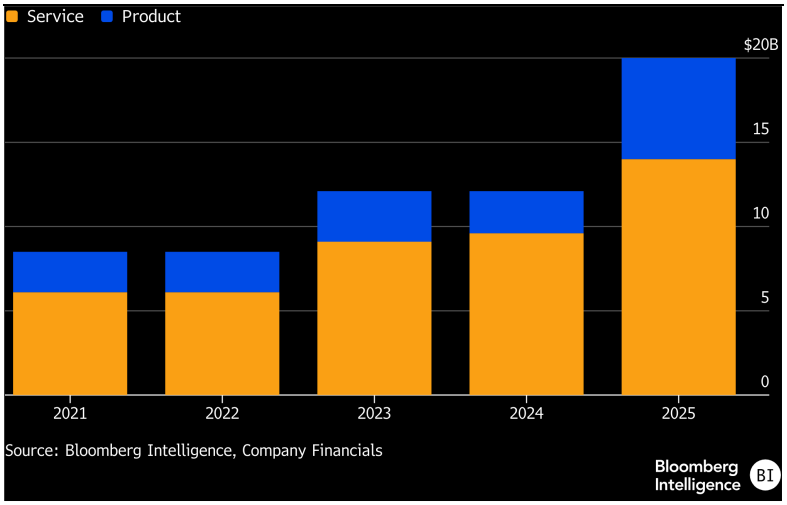

Bloomberg Intelligence BI

Backlog Conversion Tests Execution Quality

Bloom Energy's backlog provides visibility into its AI-power expansion, but the next test is conversion quality. Total contracted obligations approached $20 billion in 2025, led by service commitments, while product orders increased about 2.5x, widening the bridge between orders and factory slots, shipments, installation and service revenue.

The financial value depends on cadence: Customer deposits and milestone payments can fund growth, though delayed commissioning or inventory building risk deferring sales and absorbing cash. Backlog quality matters more than size as Oracle, AEP and Brookfield commitments scale. Key markers include conversion timing, product gross margin, service revenue and whether large projects require customer financing or working-capital support. (09/01/26)

Total Backlog Approached $20 Billion in 2025

Source: Bloomberg Intelligence, Company Financials

Bloomberg Intelligence BI

Factory Expansion Must Match AI Orders

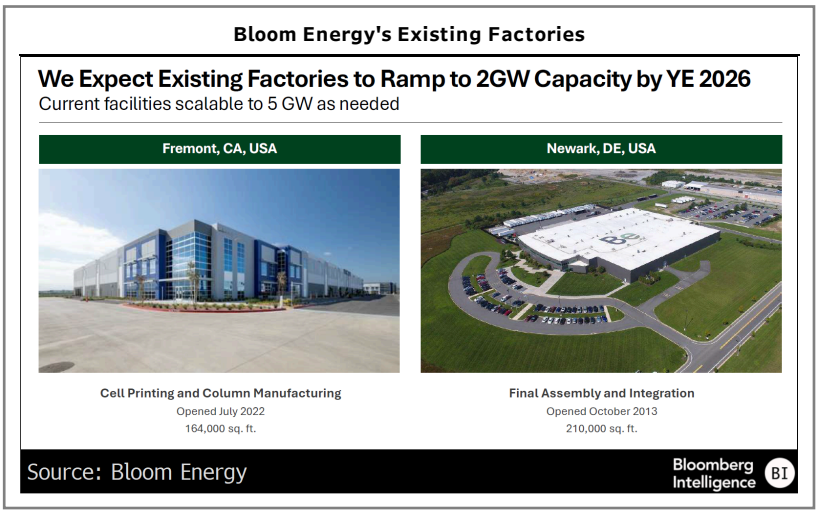

Bloom Energy's factory ramp-up is now the execution hurdle for its AI data-center push. Management says existing plants can reach 2 GW of capacity by year-end and scale up to 5 GW as needed, but the order book requires more than nameplate output. Oracle's 1.2 GW deployment, the broader 2.8 GW

This report may not be modified or altered in any way. master agreement and AEP's utility channel test production slots, parts availability, site preparation, gas access, installation crews and commissioning.

Operating leverage can expand if exact-copy manufacturing lifts throughput and absorption, though growth risks getting trapped in inventory, delayed deployments or service costs before revenue is recognized. Factory scale should be judged by shipments, installation cadence and cash conversion, not capacity alone. (09/01/26)

Fuel Cells Offer Faster Route to Gigawatt Scale

Bloom Energy's speed-to-power pitch anchors its data-center case. The company says fuel cells reached 1 GW of commercial capacity faster than wind, reciprocating engines, gas turbines, storage or solar, suggesting modular systems can deliver on-site power in as little as 90 days. That matters when AI data-center developers face grid queues, substation bottlenecks and utility timelines that don't match customer build-out plans.

The comparison, provided by the company and therefore definition-sensitive, supports Bloom's speed advantage rather than proving a technology ranking. The key question is whether faster deployment offsets higher costs, fuel-procurement complexity and permitting work enough to make the company a preferred bridge to grid power. That trade-off defines data-center upside. (09/01/26)

This report may not be modified or altered in any way. The BLOOMBERG PROFESSIONAL service and BLOOMBERG Data are owned and distributed locally by Bloomberg Finance LP ("BFLP") and its subsidiaries in all jurisdictions other than Argentina, Bermuda, China, India, Japan and Korea (the ("BFLP Countries"). Path to Hydrogen

Bloom Energy Hydrogen Flexibility Won't Boost Revenue View, Yet

Bloom Energy's hydrogen story is more about optionality than a near-term sales driver, with solid-oxide technology supporting fuel-cell power and electrolysis. The platform screens well on efficiency, but the financial debate centers on whether lower electricity intensity can translate into orders, factory utilization and service revenue beyond natural-gas-powered data-center growth. (07/16/26)

Solid-Oxide Tech Provides Efficiency Edge

Bloom Energy's solid-oxide platform gives it a hydrogen option without making the chemical element central to its near-term prospects. The same high-temperature ceramic technology that powers energy servers supports electrolysis, where the company's system compares favorably with proton-exchange membrane (PEM) and alkaline alternatives on electricity use, materials availability and learning curve. That matters because lower power intensity can improve project economics for industrial customers with cheap clean electricity or usable waste heat. The commercial test is whether that edge converts pilots into repeatable orders, rather than simply proving Bloom has a more efficient architecture. (07/16/26)

Solid-Oxide Platform Compares Favorably

Technology Comparison: Solid Oxide Electrolysis' Advantage

	PEM Electrolysis	Alkaline Electrolysis	Solid Oxide Electrolysis
Description	Based on polymer membrane on a plate under high voltage and current	Production reaction occuring in liquid alkaline solution	Solid ceramic material as electrolyte operating at high heat to reduce elctrical needs
Materials Availability	Limited (PGMs)	High	High (Robust Supply Chain)
Efficiency (kWh/kg)	52	54	37-44
Estimated Learning Rate	13%	9%	28%
	Developing	Mature	Mature

Source: Bloom Energy, Bloomberg Intelligence

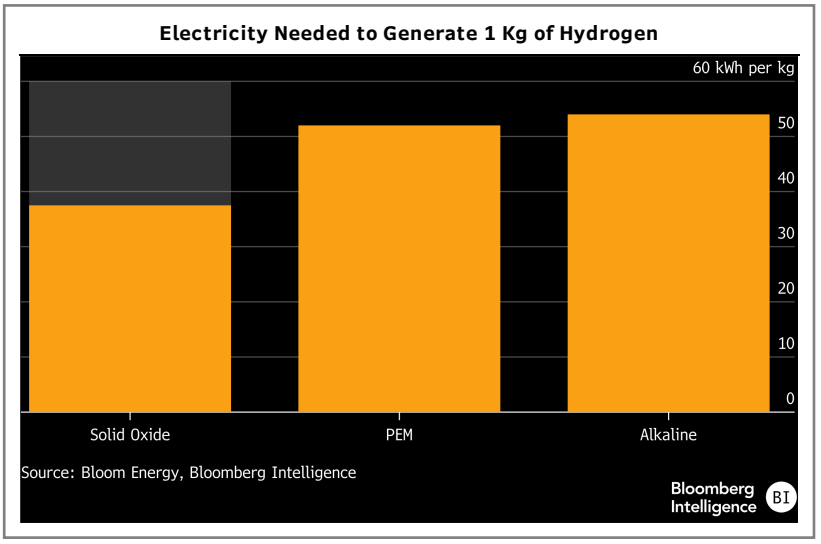

Bloomberg Intelligence

Lower Power Requirements Can Improve Returns

Bloom Energy's lower electricity intensity can improve green-hydrogen returns, since power is the largest variable cost in production. The chart shows solid oxide requires fewer kilowatt-hours per kilogram of hydrogen than proton-exchange membrane and alkaline systems, potentially cutting operating expenses and offsetting difficult hydrogen economics. The edge is most valuable at industrial sites with cheap clean power, usable waste heat and steady demand, given lower operating costs and higher utilization shorten payback periods. Lower power use absent those conditions risks leaving projects unfinanceable. (07/16/26)

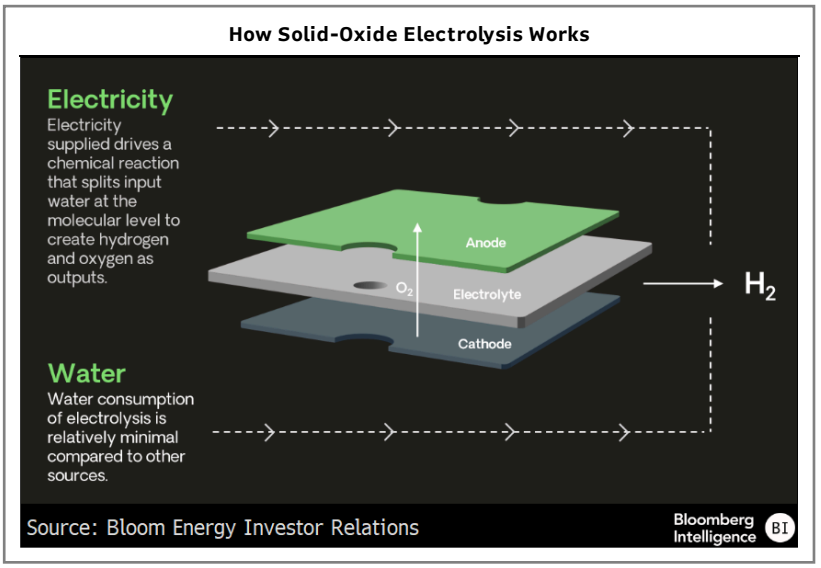

This report may not be modified or altered in any way. The BLOOMBERG PROFESSIONAL service and BLOOMBERG Data are owned and distributed locally by Bloomberg Finance LP ("BFLP") and its subsidiaries in all jurisdictions other than Argentina, Bermuda, China, India, Japan and Korea (the ("BFLP Countries"). BFLP, BLP and their affiliates do not provide investment advice, and nothing herein shall constitute an offer of financial instruments by BFLP, BLP or their affiliates.

This document is being provided for the exclusive use of YUBO SUI at THE CHINESE UNIVERSITY OF HONG KONG. Not for redistribution.

Hydrogen Needs Scale to Bring Tangible Benefits

Hydrogen only matters financially if Bloom converts its efficiency edge into recurring equipment, service and factory-utilization gains. Electrolyzers can add a second solid-oxide revenue stream beyond energy servers, though customers' need for clean electricity, heat integration, off-take contracts and financing before ordering at scale suggests the timing will trail data-center power demand. For now, hydrogen provides optionality rather than model support. Repeatable projects could lift solid-oxide volumes and improve manufacturing absorption, but a pilot-heavy market risks extending procurement cycles, leaving deposits uneven and weakening cash conversion. Hydrogen should remain outside the core 2026-28 thesis until orders ramp up. (07/16/26)

This report may not be modified or altered in any way. Cash Flow Inflection

Bloom Energy Cash-Flow Expansion to Follow AI Revenue Ramp-Up

Bloom Energy's cash-flow inflection can accelerate in 2026 as onsite power-server adoption rises with AI data-center demand. Operating cash flow is poised to climb nearly 40% vs. 2025 to $157 million, while $600-$750 million operating-income guidance points to stronger leverage as enterprise demand scales up toward gigawatt-scale deployments. (07/21/26)

Free Cash Flow Depends on Conversion Quality

Bloom Energy's free-cash-flow expansion hinges on clean project conversion that avoids long collection lags or unbilled deployment expenses. Achieving positive operating cash flow in 2024-25 after years of deficits shows the commercial model has improved, but gigawatt-scale data-center deployments raise the execution bar by adding significant working-capital demands. Customer deposits need to fund more upfront hardware costs, inventory must turn over faster and crews need to meet strict installation milestones to prevent liquidity drag. (07/21/26)

Operating Activities Drive Positive Cash Infusions

Bloom Energy's cash position can strengthen as AI-driven revenue growth feeds operating leverage and lowers net debt. The company ended 2025 with more than $2.4 billion in cash after a convertible-debt transaction, producing positive operating cash flow for a second straight year at $114 million vs. $92 million in 2024. We think the balance sheet is set to move further into net cash through 2030 as adjusted Ebitda scales up with product shipments.

The key question is whether backlog conversion and service revenue from installed systems can offset installation timing, inventory needs and financing structures. Sustained net cash would give Bloom more flexibility to fund its factory ramp-up, support data-center deployments and absorb project delays without relying heavily on external capital. (07/21/26)

Bloom Energy Gets Data-Center Opening Amid Gas-Turbine Delays

Bloom Energy's backlog and top-line growth prove that AI data-center demand is real as gas-turbine wait times stretch and grid connections lag behind. The backlog approached $20 billion in 2025, revenue rose 37% to $2.02 billion and non-GAAP gross margin reached 30.3%. Partnerships with Oracle and Brookfield add scale, while 2026 guidance calls for $3.4-$3.8 billion of sales and 34% gross margin.

Solid Oxide Fuel Cell Emissions Up to 30% Lower Than Combustion

(08/28/26)

Peers

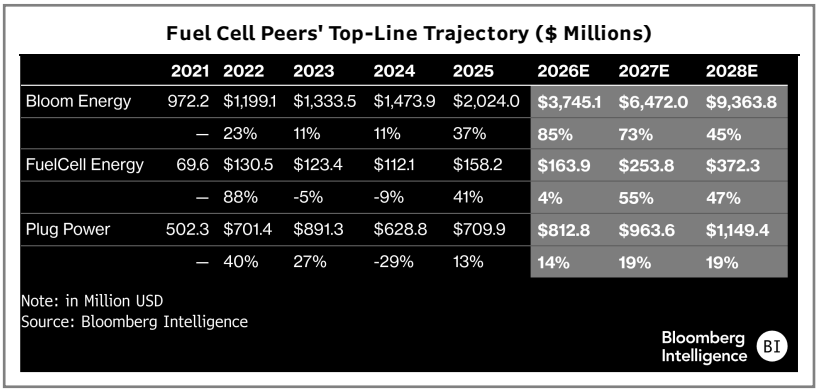

Bloom Energy Leads US Fuel-Cell Peer Group on Sales, Backlog

Bloom Energy's AI data-center demand separates it from US fuel-cell rivals, with consensus calling for 2026 sales to rise more than 80% vs. low-single-digit growth for FuelCell Energy and midteens gains for Plug Power. That gap helps explain Bloom's larger rally, but it also raises the conversion bar: Backlog, margin and cash flow need to scale up with demand for the peer premium to hold.

AI Data Centers Drove Share-Price Rally

(10/01/26)

Industry Themes

Unconventional Power Solutions

Microgrids, Fuel Cells, Boilers Can Help Ease AI Power Crunch

Contributing Analysts Scott J Levine (Industrials) & Ronak Bhalla (Industrials)

Microgrids offered by Liberty Energy, fuel cells from Bloom Energy and boilers supplied by Babcock & Wilcox are among innovative solutions that can help meet AI data centers' urgent power needs. Hyperscalers facing 5-7-year waitlists for large-scale turbines and grid interconnects are seeking alternatives that can be deployed more quickly. (10/05/26)

Hyperscalers Struggle in Power Search

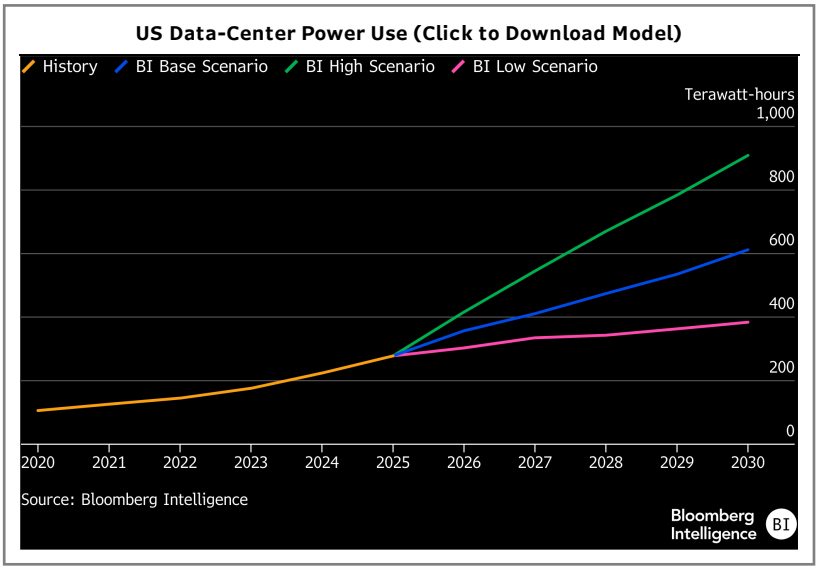

Contributing Analysts Scott J Levine (Industrials) & Ronak Bhalla (Industrials)

Hyperscalers are struggling to meet urgent electricity needs given lengthy timelines to build new power plants and capacity limitations among industrial equipment manufacturers. Anecdotes suggesting 3-4 year waiting periods for gas-turbine deliveries from the likes of GE Vernova suggest data centers need alternative power sources to meet near-term power requirements. New grid-interconnect agreements could take 2-7 years, reports indicate, giving off-grid solutions a foothold, particularly for remote facilities.

BI analyst Rob Barnett's base-case scenario suggests over 600 terawatt hours of additional electricity will be needed to support US growth in AI computing by 2030. Caterpillar recently announced plans to double its engine and turbine production capacity by that year to meet growing demand. (10/01/26)

Distributed Solutions Offer Flexibility

Contributing Analysts Scott J Levine (Industrials) & Ronak Bhalla (Industrials)

Oilfield service companies such as Liberty Energy, ProPetro and Halliburton are developing distributed power solutions that appear suitable for data centers, particularly remote ones with limited grid access. These systems, initially designed to power gas and electric frac fleets, can also be deployed for other purposes. They typically use reciprocating gas engines or small-scale turbines from suppliers like Caterpillar and INNIO-Jenbacher.

Liberty expects to have 1 gigawatt of power-generating equipment on hand by the end of 2027 and 3 GW deployed by 2029. ProPetro targets 750 megawatts by 2028 and 2.6 GW by 2032. Halliburton's joint-venture partner Voltagrid plans to deploy 4.3 GW of capacity by 2028 and recently struck an agreement to power Oracle data centers. (10/01/26)

Summary of Microgrid Power Offerings

	Program / Unit	Capacity Targets	Technology	Customer Focus	Financial Profile
Liberty	Liberty Power Innovations	3GW by 2029 (400 MW under contract)	Reciprocating gas engines from Jenbacher	Data centers and industrial clients via microgrid platforms	Unlevered high-teens returns, 5-6 year payback, $1.5 million cost per MW
Halliburton	VoltaGrid Partnership	4.3 GW by 2028; ~7.5 GW order book by 2030	Supply agreement with INNIO for 1.5 GW, including 300MW of gas engines	Oracle and global data center operators	Equity stake (~20%) with incremental investments
ProPetro	ProPWR	2.6 GW by 2032 (240 MW under contract)	Initially recips, empahsis, may shift; Framework with CAT	Oilfield and data center users under long-term take-or-pay deals	$1.4-$1.5 million cost per MW; 4-6 year payback

Fuel Cells May Be Fastest Alternative

Contributing Analysts Scott J Levine (Industrials) & Ronak Bhalla (Industrials)

Fuel cells offer another power solution for data centers, particularly those for which time is of the essence. Such systems can be installed within a matter of months vs. multiyear waits for conventional generating equipment. Though fuel-cells are commonly designed to run on hydrogen, solid-oxide systems such as those produced by Bloom Energy and Ceres Power can also use more widely available

natural gas. Furthermore, they provide on-site power, which can be more reliable than grid-based solutions, albeit potentially more costly.

Bloom Energy recently installed fuel cells at Oracle data centers in under 60 days, faster than initial expectations of 90 days. It has also announced supply agreements with electric utility AEP and infrastructure investor Brookfield Asset Management. (10/01/26)

Bloom Fuel-Cell Attributes

Steam Offers Timing Edge Over Gas

Contributing Analysts Scott J Levine (Industrials) & Ronak Bhalla (Industrials)

Boilers such as those offered by Babcock & Wilcox provide an alternative for customers facing lengthy waits for gas turbines or reciprocating engines. The company recently struck a $2.4 billion deal with an independent power producer backed by Applied Digital to build a 1.2-gigawatt power plant powered by its own boilers and steam turbines provided by Siemens Energy. Though less efficient than combined-cycle power units, the Babcock units are expected to perform at least on a par with simple-cycle gas "peaker" plants that meet urgent needs during the height of winter and summer demand.

B&W received a full notice to proceed on the project in 1Q and expects to complete the job in 2028. The company's stock has risen more than fivefold since the initial preliminary contract announcement on Nov. 4, 2025. (10/01/26)

Key Power Source Differences

	Main Power Technology	Max Power Output	Deployment Speed	Key Focus Area
Caterpillar	Reciprocating Engines / Gas Turbines	Up to 39 MW per unit	Rapid deployment for engines & turbines	Scaling to 50 GW by 2030
Bloom Energy	Solid Oxide Fuel Cells (SOFC)	Up to 2 MW per module	55-90 days for on-site installation	On-site modular power; 2 GW capacity by 2026
Babcock & Wilcox	Natural Gas-Fired Boilers / Steam Turbines	300 MW per unit	Modular plant design for fast scale-up	High-capacity thermal power for hyperscale data centers

AI Capex Surge

AI Power Shock Lifts Sales Outlook for First Solar, Bloom, Peers

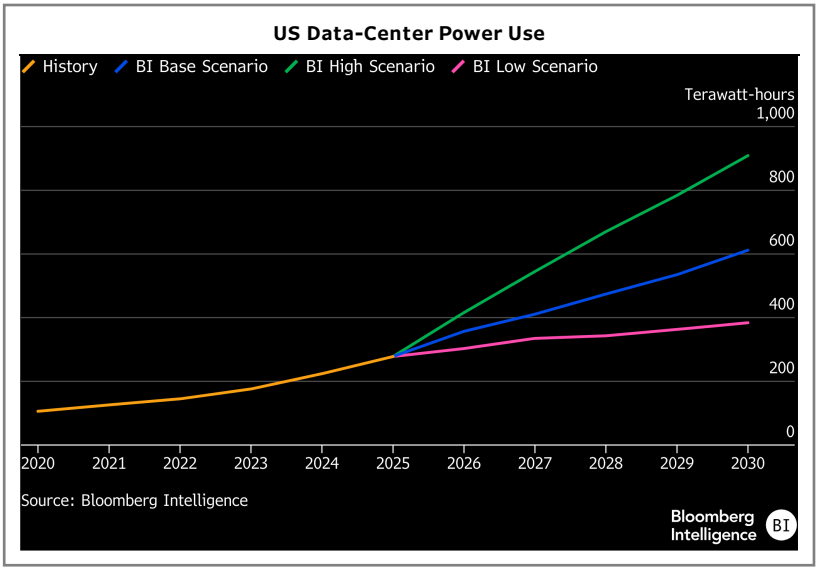

Contributing Analysts Patricio Alvarez (Energy)

Big tech's AI build-out and a $4 trillion hyperscale capital spending wave are set to double US data-center power demand to nearly 600 terawatt hours by 2030, our analysis shows. That surge favors fast-to-deploy solar, storage and gas, creating substantial consensus sales upside potential for First Solar, Nextpower, Shoals, Bloom Energy and clean-energy peers. (05/11/26)

$4 Trillion Capex Wave to Redraw US Power Map

Contributing Analysts Ryan Collins (Energy)

Hyperscalers Amazon Web Services, Microsoft, Google, Meta and Oracle will spend nearly $4 trillion on data-center capital expenditures in 2026-30, based on updated BI tech-team modeling. Those outlays mark a paradigm shift in the US energy landscape, propelling power demand from data centers to roughly 600 terawatt hours by 2030 vs. a baseline of about 275 TWh in 2025, or 7% of US power demand. This implied 18% compound annual growth rate exceeds historical trends and underpins the urgent need for new generation capacity. (05/11/26)

First Solar, Peers to Gain From AI Power Surge

AI-driven power demand is boosting US need for solar and batteries, opening a premium growth channel for utility-scale suppliers. First Solar appears set to extend its lead, with modules recently deployed at Google-partnered projects in Texas. The company ended 1Q with a contracted backlog of 47.9 GW, providing significant revenue visibility through 2030. NextPower, Array, Shoals and other tracker and electrical-balance-of-system suppliers can also benefit as utility-scale projects accelerate. This cycle favors those with domestic manufacturing and a clear technology roadmap for giga-scale plants.

The median company in our US solar peer group is expected to boost sales by 13% a year in 2026-28 vs. an 18% CAGR for projected data-center power demand. (05/11/26)

Hyperscaler Capex Jump Speeds US Power Planning

Contributing Analysts Patricio Alvarez (Energy)

The US added about 6.5 GW of new data-center capacity in 2025, but the AI pipeline points to a steeper climb. Spending by the Big Five -- Amazon, Alphabet, Microsoft, Meta and Oracle -- is expected to exceed $700 billion in 2026 vs. $414 billion last year, likely lifting US data-center additions above 10 GW this year. To support a build-out of more than 10 GW will require about $70 billion of investment in new power generation, based on our calculations, plus firming assets across a portfolio of gas turbines, solar and battery storage. (05/11/26)

Data Centers May Reach 14% of Power Demand by 2030

Contributing Analysts Patricio Alvarez (Energy)

Data-center electricity use in the US could climb to about 600 TWh by 2030, or roughly 14% of national power use, from about 7% in 2025, based on our scenario analysis. That sits comfortably above the Department of Energy's 2028 range and close to the Electric Power Research Institute's 2030 medium case. The implication is simple: AI no longer looks like a niche load add-on. It's large enough to alter capacity planning, resource procurement and the earnings backdrop for fast-build generation and storage technologies. (05/11/26)

AI Likely to Turbocharge Solar, Battery Demand

Contributing Analysts Ryan Collins (Energy)

Solar and battery storage, the fastest-growing segments within energy, are poised to benefit as Meta, Microsoft, Amazon, Alphabet and other hyperscalers seek emissions-free electricity sources to adhere to their sustainability goals. Solar-plus-storage is also practical for data centers because these projects can be constructed in less than 18 months vs. several years for wind or gas-power plants and more than a decade for nuclear. Regardless of the technology, many power projects have multiyear permitting and development timelines.

Natural gas backup generation and combined-cycle power plants are likely to also benefit from the expected power-generation boost, given these technologies pair nicely with intermittent ones. (05/11/26)

US Manufacturing-Related Construction Spending
